

1. Intro

Period: 2

Names: Stuti Girdhar, Amanda Louie

Group Name: Gals

Project Title: Tom and Jerry(s)

2. Description

Describe your project:

- A single-user game where the user (cat) tries to catch as many mice as possible. There are multiple levels that the user can advance to. This game is similar to whack-a-mole, with the mice periodically disappearing and reappearing. The user is given a set time to reach a goal number of mice caught (number will increase with each level, time will decrease with each level). If the user does not reach the goal, the user loses the game. If the user catches the goal number of mice within the time limit, they are allowed to continue catching mice (this will contribute to their high score).

List and explain functionalities:

- Arrow keys: user uses arrow keys to navigate the cat, allows user to move up/down/left/right
- Background: consists of a grid (house) where mice will pop up, mice's positions will be randomly generated; the user will lose the game if they touch certain furniture
- Timer: different time limits will be set per level
- Scoreboard: keeps track of number of mice caught + high score

3. UML Diagram

4. How does it work?

The user will assume the role of a cat (which will appear on screen) and try to catch as many mice as possible. At each level, the user will use the arrow keys to navigate their cat to catch mice across the screen, with the mice being caught when the cat reaches their position. The user will need to avoid furniture throughout the screen as they make their way towards catching mice. Mice will periodically disappear and reappear until caught, similar to the game of whack-a-mole. The user is given a set time to reach a goal number of mice caught: the goal will increase and the time given will decrease as the player advances levels. If the user does not reach the goal or touches any furniture, the user loses the game. If the user catches the goal number of mice within the time limit, they are allowed to continue catching mice (this will contribute to their high

score). A scoreboard will display the user's current score and high score and a timer will display the user's remaining time for the level.

5. Log

- Amanda: worked with Stuti to create the design doc, implemented the mice class, created the instructions screen, created the death screen, implemented the mousePressed method, debugged background class methods, worked with Stuti to find images for levels 1-3, worked with Stuti to set up the maps for levels 1-3
 - Functionalities: buttons (to progress between screens), scoreboard (keeping track of current and high scores)
- Stuti: worked with Amanda to create the design doc, implemented the cat and furniture classes, implemented some background class methods (setup, death, restart, checkMouse, keyPressed), created the start and transition screens, worked with Amanda to find images for levels 1-3, worked with Amanda to set up the maps for levels 1-3
 - Functionalities: timer, movement (using the arrow keys)
